This listing of claims will replace all prior versions, and listings, of claims in the application:

1   Claim 1 (original): An information terminal device,
2   comprising:
3   an acquisition unit acquiring language
4   identification information concerning a language used on
5   a display screen;
6   a storage unit storing address information of a
7   server;
8   a language identification information synthesizer
9   synthesizing the language identification information into
10   the address information; and
11   a transmitter transmitting the address information
12   to the server.

1   Claim 2 (original): The information terminal device
2   according to claim 1, wherein the language identification
3   information is a serial number of software operating on
4   the information terminal device.

1   Claim 3 (original): The information terminal device
2   according to claim 1, wherein the language identification
3   information is a model number or a serial number of a
4   peripheral device connected to the information terminal
5   device.

1   Claim 4 (original): The information terminal device
2   according to claim 1, wherein the language identification
3   information synthesizer synthesizes the language
4   identification information which is different from a

3

5   domain name or an IP address representing a country of a

6   transmission source so as to follow the domain name or IP

7   address.

1   Claim 5 (original): An information terminal device,

2   comprising:

3   an input unit inputting a user's voice;

4   a use language recognizer recognizing a use language

5   based on the user's voice;

6   a storage unit storing address information of a

7   server;

8   an acquisition unit acquiring language

9   identification information concerning a use language

10   recognized by the use recognition means;

11   a language identification information synthesizer

12   reading address information from the storage unit and

13   automatically synthesizing the language identification

14   information with the address information, when the

15   language identification information is acquired; and

16   a transmitter transmitting the address information

17   to a server.

1   Claim 6 (original): The information terminal device

2   according to claim 5, wherein the language identification

3   information is a serial number of software operating on

4   the information terminal device.

4

1   Claim 7 (original): The information terminal device

2   according to claim 5, wherein the language identification

3   information is a model number or a serial number of a

4   peripheral device connected to the information terminal

5   device.

1   Claim 8 (original): The information terminal device

2   according to claim 5, wherein the language identification

3   information synthesizer synthesizes the language

4   identification information which is different from a

5   domain name or an IP address representing a country of a

6   transmission source so as to follow the domain name or IP

7   address.

1   Claim 9 (original): An information terminal device,

2   comprising:

3   a display unit displaying link information for

4   linking with a transmission server on a display screen;

5   a storage unit storing address information of the

6   transmission server;

7   an acquisition unit acquiring language

8   identification information concerning a language used on

9   the display screen;

10   a language identification information synthesizer,

11   when the link information is selected, reading out the

12   address information and automatically synthesizing the

13   acquired language identification information with the

14   address information;

15   a specification unit specifying a user; and

16   a transmitter transmitting the address information

17   and user information to the server.

5

1   Claim 10 (original):   The information terminal device

2   according to claim 9, further comprising display

3   controller receiving information which can be displayed

4   in a language corresponding to the language

5   identification information from the server, and

6   displaying the information on the display unit in a

7   language corresponding to the language identification

8   information.

1   Claim 11 (original):   A computer-readable program

2   operating on an information terminal device which is

3   communicable with a server via a communication line, the

4   computer-readable program comprising:

5   code means for acquiring language identification

6   information concerning a language used on a display

7   screen;

8   code means for storing address information of a

9   server;

10   code means for, when the language identification

11   information is acquired, reading the address information

12   and automatically synthesizing the language

13   identification information with the address information;

14   and

15   code means for transmitting the address information

16   to the server.

1   Claim 12 (original):   A method of transmitting language

2   identification information recognized by a information

3   terminal device to a registered server and acquiring

4   information corresponding to the language identification

5   information from the server, the method comprising:

6   acquiring language identification information

6

7   concerning a language used on a display screen of the
8   information terminal device;
9   reading address information from the server;
10   automatically synthesizing the acquired language
11   identification information with the read address
12   information;
13   transmitting to the server, address information
14   obtained by synthesizing the language identification
15   information and specific information for specifying the
16   address information transmission user; and
17   receiving information corresponding to a type of
18   language requested from the information terminal device.

1   Claim 13 (original): A computer-readable program
2   operating on an information terminal device which is
3   communicable with a server via a communication line, the
4   computer-readable program comprising:
5   code means for storing address information of a
6   server;
7   code means for acquiring language identification
8   information concerning a language used on a display
9   screen;
10   code means for reading address information contained
11   in a transmission destination server;
12   code means for displaying link information for
13   linking with the transmission destination server on a
14   display screen;
15   code means for, when the link information is
16   selected, automatically synthesizing the acquired
17   language identification information with the read address
18   information.

7

1   Claim 14 (original): A method of transmitting language
2   identification information recognized by a information
3   terminal device to a registered server and acquiring
4   information corresponding to the language identification
5   information from the server, the method comprising:
6   displaying link information for linking with a
7   transmission destination server on a display screen;
8   acquiring language identification information
9   concerning a language used on a display screen of the
10   information terminal device;
11   reading address information from the server;
12   automatically synthesizing the acquired language
13   identification information with the out address
14   information, when the link information is selected;
15   transmitting to the server, address information
16   obtained by synthesizing the language identification
17   information and specific information for specifying the
18   address information transmission user; and
19   receiving information corresponding to a type of
20   language requested from the information terminal device.

1   Claim 15 (original): The method according to claim 14,
2   wherein the link information is an icon, and the icon
3   notifies that a function of the recognized natural
4   language can be added onto a WEB.

1   Claim 16 (original): A network system comprising:
2   an information terminal device;
3   and a server for, based on language identification
4   information transmitted from the information terminal
5   device, transmitting corresponding information based on

8

6   the language identification information, wherein the

7   information terminal device comprises:

8   a recognizer recognizing a type of natural language

9   used in a local information terminal device;

10   a determination unit determining a server targeted

11   for transmission;

12   a storage unit storing language identification

13   information for identifying the recognized language in an

14   address corresponding to the server targeted for

15   transmission;

16   a transmitter transmitting to the server the address

17   information having stored therein language identification

18   information;

19   a reception unit receiving information from the

20   server; and

21   a display unit displaying the received information,

22   and

23   the server comprises:

24   a storage unit storing a plurality of information

25   described in a plurality of natural languages

26   corresponding to the language identification information;

27   a selector selecting from the storage unit, based on

28   the language identification information stored in the

29   address information, information which can be described

30   in a predetermined language which can be displayed in a

31   language corresponding to the language identification

32   information and a program corresponding to the language

33   identification information; and

34   a transmitter transmitting the selected display

35   information to the information terminal device.

Claims 17-36: Canceled
